

Cloud-Native-Shared-Responsibility-Model

- The shared responsibility model in cloud-native security divides responsibility for security between the cloud provider and the customer. While the cloud provider secures the underlying infrastructure (like hardware and networking), the customer is responsible for securing their own data, applications, and security configurations within the cloud. This model ensures that both parties understand their individual roles in securing the overall cloud environment.

Cloud Provider's Responsibility:

- The cloud provider is responsible for the physical infrastructure, including data centers, networks, and hardware. They also manage security controls related to the cloud platform itself.

Customer's Responsibility:

- The customer is responsible for securing their data, applications, and operating systems within the cloud environment. This includes managing identity and access management, patching vulnerabilities, and ensuring compliance with security standards.

Cloud-Native Specifics:

- In cloud-native environments, the customer's responsibilities often extend to securing their containerized applications and infrastructure, including managing security configurations within Kubernetes clusters and ensuring secure deployments.

Importance of the Model:

- The shared responsibility model ensures a clear division of duties, reducing the risk of misunderstandings or gaps in security coverage. It also allows for greater collaboration between the cloud provider and the customer in securing the cloud environment.

Examples:

AWS:

- Amazon Web Services provides a secure cloud infrastructure, while customers are responsible for securing their applications, data, and operating systems within that infrastructure.

Azure:

- Microsoft Azure manages the underlying infrastructure, while customers are responsible for securing their applications, data, and configurations within the Azure environment.

Google Cloud Platform:

- Google Cloud Platform secures the cloud infrastructure, and customers are responsible for securing their applications, data, and identity and access management within GCP.
