

Linux - Foundation

- The Linux Foundation started as Open Source Development Labs in 2000 to standardize and promote the open-source operating system kernel Linux. [3] It merged with Free Standards Group in 2007. The foundation has since evolved to promote open-source projects beyond the Linux OS as a "foundation of foundations" that hosts a variety of projects spanning topics such as cloud, networking, blockchain, and hardware.[4] The foundation also hosts annual educational events among the Linux community, including the Linux Kernel Developers Summit and the Open Source Summit.[5][6]

Cloud Native Computing Foundation (CNCF)

- The Cloud Native Computing Foundation (CNCF) is a non-profit organization that promotes the adoption of cloud-native computing practices and technologies. It is a vendor-neutral hub for cloud-native projects, hosting and supporting open-source initiatives like Kubernetes, Prometheus, and Envoy. CNCF aims to foster collaboration among developers, end-users, and vendors to advance the cloud-native ecosystem.

Key aspects of the CNCF:

Vendor-Neutrality:

- The CNCF is not affiliated with any specific cloud provider or vendor. This neutrality helps ensure that the projects it supports are widely usable and interoperable across different platforms.

Open Source:

- CNCF primarily focuses on open-source projects, encouraging community participation and collaboration.

Cloud Native Ecosystem:

- The CNCF promotes technologies like containers, microservices, and service meshes, which are key components of cloud-native architectures.

Project Hosting and Support:

- CNCF hosts a variety of open-source projects that form the backbone of cloud-native computing. These projects are developed and maintained by the open-source community.

Community Building:

- The CNCF fosters a community of developers, end-users, and vendors to collaborate on cloud-native technologies.

Training and Certification:

- The CNCF also offers training courses and certification programs to help individuals and organizations learn about and adopt cloud-native technologies.

Sustainability:

- The CNCF works to ensure the long-term sustainability of cloud-native technologies through open-source governance and community involvement.

Examples of CNCF projects:

- Kubernetes: An open-source container orchestration platform.
- Prometheus: An open-source monitoring system.
- Envoy: An open-source service proxy for cloud-native environments.
- containerd: An open-source container runtime.
- CoreDNS: An open-source DNS server for Kubernetes.
- Helm: A package manager for Kubernetes.
